Allergic reactions

There are persons who react allergic to cats, food, medicines or to metals which have contact with their skin. These so-called allergic sufferers react hypersensitive to certain materials, e.g. when eating, when touching their skin, when breathing or when being bitten by an insect.

Allergy means a wrong reaction of a person's immune system to certain materials, which do not at all burden a non-allergic person. So please note that sufferings are caused by hypersensitivity of an allergic sufferer and not by the danger of materials.

For this reason, we cannot generally answer the question whether DLW floor coverings contain materials which cause allergies. But we can inform on certain compounds of our floor coverings, if a person names materials against he or she reacts allergic to. But it's the doctors' task to name the allergic material a person reacts to.

If there is a reasonable presumption that a DLW flooring causes allergic reactions to a person, but detailed compound of the irritating material is unknown, we are ready to confidentially inform the caring doctor about the composition of our floor covering concerned.

Understandably, we won't give this information to private individuals. In our long-term experience, we do not know a single case where one of our floorings has caused an allergy.

Additionally, please note that a lot of people react to home dust breathed in. Mostly, these extremely fine dust particles are set free after swirling the room's air. We recommend to use vacuum cleaners with microfilter systems.
